## INTEGRATING SEND GRID WITH PYTHON FLASK

Date	11 NOV 2022
Team ID	PNT2022TMID36412
Project Name	Nutrition Assistant Application

## **Creating API key:**

```
| Cimport sendgrid | Import se
```

## **SENDGRID PYTHON CODE:**

```
1 import os
2 from sendgrid import SendGridAPIClient
3 from sendgrid.helpers.mail import Mail
5 message = Mail (
6
      from email='from email@example.com',
      to emails='to@example.com',
8
      subject='Sending with Twilio SendGrid is Fun',
      html_content='<strong>and easy to do anywhere, even with
  Python</strong>')
10 try:
      sg = SendGridAPIClient(os.environ.get('SENDGRID API KEY'))
11
12
     response = sg.send(message)
13     print(response.status_code)
     print(response.body)
14
15
     print(response.headers)
16 except Exception as e:
17
   print(e.message)
```

## HTTP CLIENT PROGRAM

```
1 """HTTP Client library"""
2 import json
3 import logging
4 from .exceptions import handle_error
5
6 try:
7  # Python 3
8  import urllib.request as urllib
9  from urllib.parse import urlencode
10  from urllib.error import HTTPError
11 except ImportError:
12  # Python 2
```

```
17 logger = logging.getLogger(__name_)
     def __init__(self, response):
24
          :param response: The return value from a open call
                          on a urllib.build_opener()
          :type response: urllib response object
          self. status code = response.getcode()
          self. body = response.read()
          self._headers = response.info()
34
         :return: integer, status code of API call
     def body(self):
         :return: response from the API
```

```

          self. url path = url path or []
          self.append slash = append slash
               Or just pass the version as part of the URL
               (e.g. client. ('/v3'))
104
            :param url: URI portion of the full URL being requested
106
            :type url: string
107
  url)
110
111
        def build url(self, query params):
112
113
114
            :param query params: A dictionary of all the query
```

```
parameters
            :type query_params: dictionary
116
117
            while count < len(self._url_path):
121
                url += '/()'.format(self._url_path[count])
122
123
124
            if self.append slash:
126
127
128
            ! query params:
129
                url_values = urlencode(sorted(query_params.items()),
130
131
133
134
135
136
        def update headers (self, request headers):
139
140
141
            :param request_headers: headers to set for the API call
142
            :type request_headers: dictionary
143
            :return: dictionary
144
145
            self.request headers.update(request headers)
146
        def _build_client(self, name=None):
147
```

```
148
149
            :param name: Name of the url segment
            :type name: string
154
            url path = self. url path + [name] if name else
  self. url path
            return Client (host=self.host,
156
                           request headers=self.request headers,
                           url path=url path,
159
                           append slash=self.append slash,
                           timeout=self.timeout)
162
        def make request (self, opener, request, timeout=Mone):
163
164
165
166
             :param opener:
             :type opener:
             :param request: url payload to request
             :type request: urllib.Request object
170
             :param timeout: timeout value or None
171
             :type timeout: float
172
             :return: urllib response
173
174
             timeout = timeout or self.timeout
175
176
                 return opener.open(request, timeout=timeout)
177
            except HTTPError as err:
178
                 exc = handle error(err)
179
                 logger.debug('{method} Response: {status}
```

```
method=request.get method(),
                    status=exc.status code,
                    body=exc.body))
184
186
187
               (e.g. /your/api/{variable value}/call)
               Another example: if you have a Python reserved word,
190
               in your url, you must use this method.
191
192
            :param name: Name of the url segment
           :type name: strling
193
194
195
196
           return self. build client (name)
197
198
       def getattr (self, name):
               (e.g. client.name.name.method())
               You can also add a version number by using
 .version(<int>)
            :param name: Name of the url segment or method call
204
            :type name: string or integer if name == version
            :return: mixed
                def get version (*args, **kwargs):
210
                    :param args: dict of settings
211
                    :param kwargs: unused
```

```
212
213
214
                    self. version = args[0]
215
216
                return get version
217
218
219
            if name in self.methods:
               method = name.upper()
221
               def http request(
223
                        request body=None,
224
                        query params=None,
225
                        request headers=None,
226
                        timeout=None,
227
228
229
                    :param timeout: HTTP request timeout. Will be
 propagated to
230
                        urllib client
231
                    :type timeout: float
232
                    :param request headers: HTTP headers. Will be
  merged into
233
                        current client object state
234
                    :type request headers: dict
235
                    :param query params: HTTP query parameters
236
                    :type query params: dict
